

Module assignment: Project To DO List

Q. We're going to be creating a complete To-Do list application in this assignment. You can finish the entire assignment in a single component (App.js).

1. In the input box, enter the task. It should be stored in the Node-persist storage and the same should be displayed right below in the tasks list section.
2. On restarting the application, the old node persist data should be deleted (use `storage.clear()` function to achieve this).
3. For this project, you need 2 folders inside the project folder – backend and frontend, each with its own package.json files and node modules.

The final application should look like this:

To Do List App

Enter the task:

Add Task

Deep work for 3 hours

Go to the Gym and work out for an hour

Study Python and create 5 projects

Meditate for 15 minutes
